CS4102 Algorithms

Spring 2020

Today's Keywords

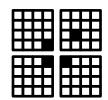

- Reductions
- Bipartite Matching

CLRS Readings

• Chapter 34

Divide and Conquer*

Divide:

 Break the problem into multiple subproblems, each smaller instances of the original

Conquer:

- If the suproblems are "large":
 - Solve each subproblem recursively
- If the subproblems are "small":
 - Solve them directly (base case)

• Combine:

Merge together solutions to subproblems

Dynamic Programming

- Requires Optimal Substructure
 - Solution to larger problem contains the solutions to smaller ones
- Idea:
 - 1. Identify recursive structure of the problem
 - 2. Select a good order for solving subproblems
 - Usually smallest problem first

Greedy Algorithms

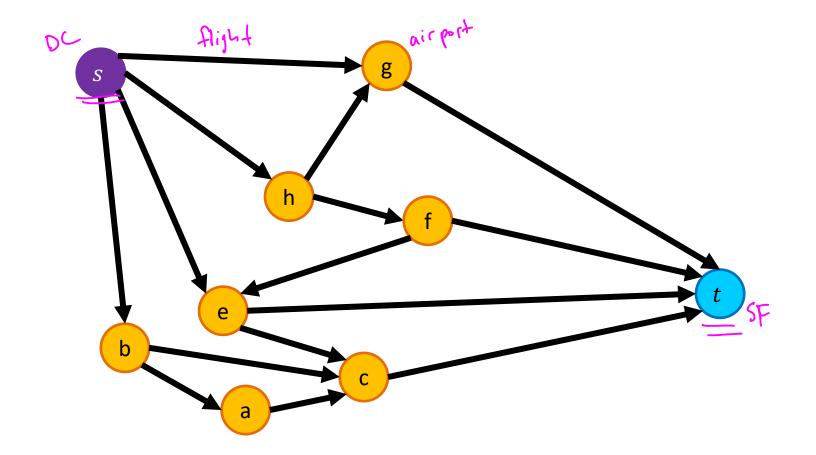

- Require Optimal Substructure
 - Solution to larger problem contains the solution to a smaller one
 - Only one subproblem to consider!
- Idea:
 - 1. Identify a greedy choice property
 - How to make a choice guaranteed to be included in some optimal solution
 - 2. Repeatedly apply the choice property until no subproblems remain

So far

- Divide and Conquer, Dynamic Programming, Greedy
 - Take an instance of <u>Problem A</u>,
 relate it to smaller instances of <u>Problem A</u>
- · Next: Reductions
 - Take an instance of <u>Problem A</u>,
 relate it to an instance of **Problem B**

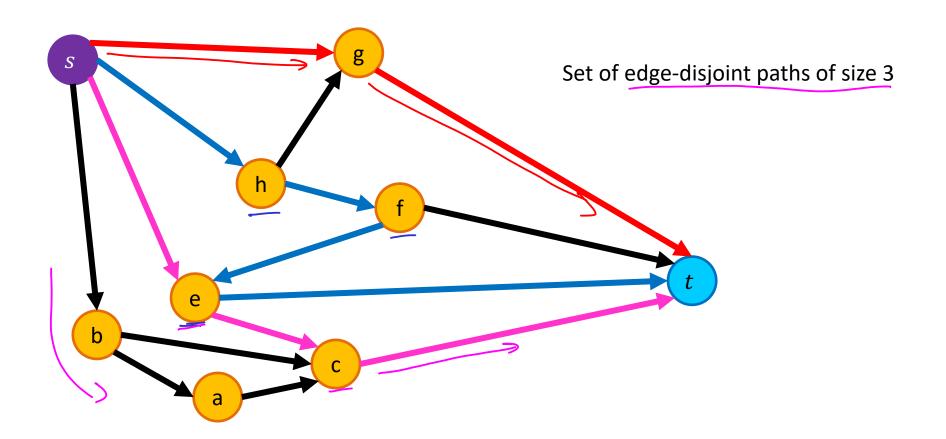

Edge-Disjoint Paths

Given a graph G = (V, E), a start node s and a destination node t, give the maximum number of paths from s to t which share no edges

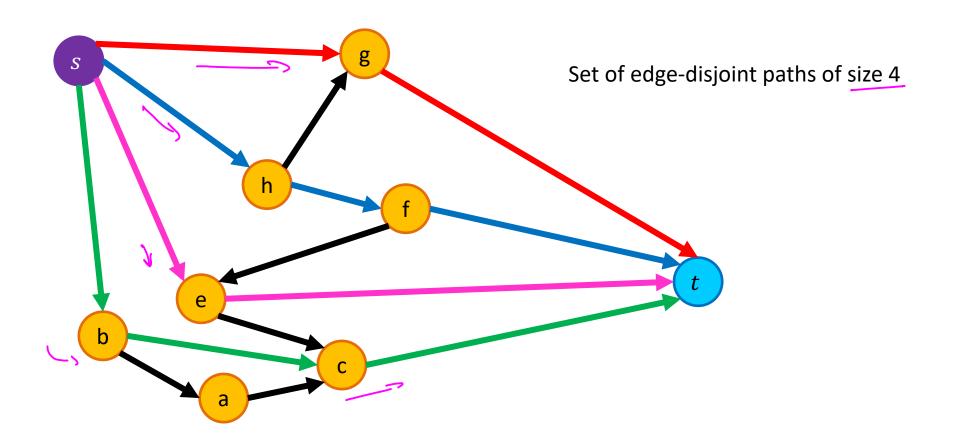

Edge-Disjoint Paths

Given a graph G = (V, E), a start node s and a destination node t, give the maximum number of paths from s to t which share no edges

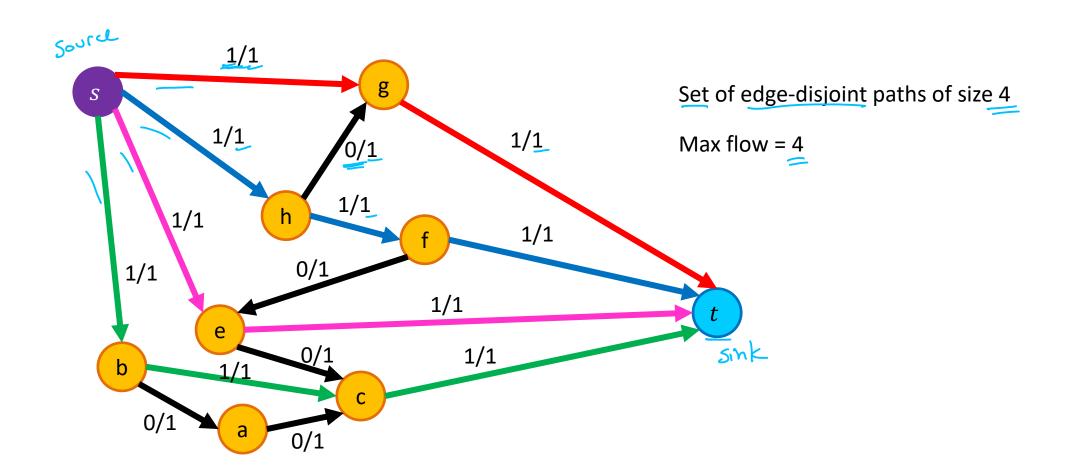

Edge-Disjoint Paths

Given a graph G = (V, E), a start node s and a destination node t, give the maximum number of paths from s to t which share no edges

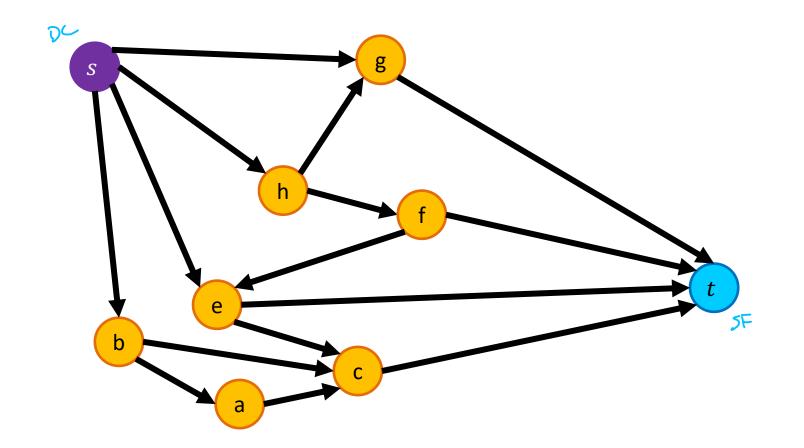

Edge-Disjoint Paths Algorithm

Make s and t the source and sink, give each edge capacity 1, find the max flow.

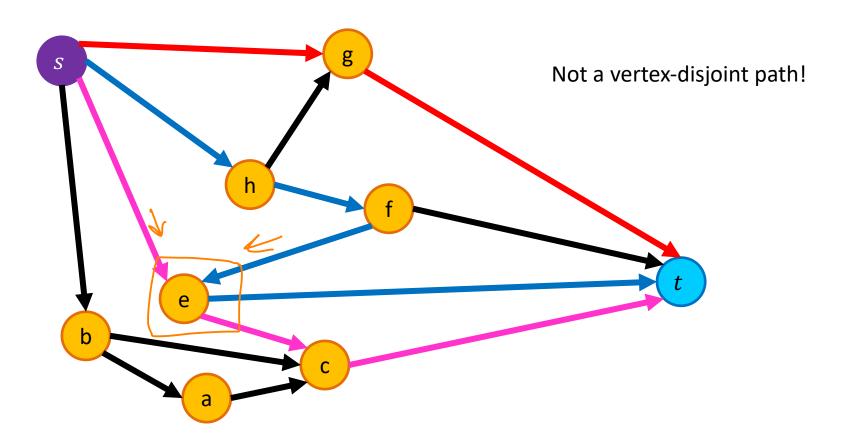

Vertex-Disjoint Paths

Given a graph G = (V, E), a start node s and a destination node t, give the maximum number of paths from s to t which share no vertices

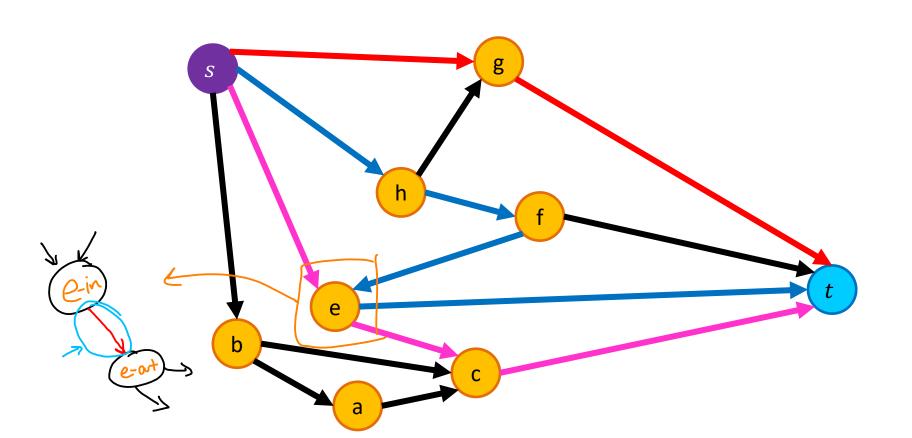

Vertex-Disjoint Paths

Given a graph G=(V,E), a start node s and a destination node t, give the maximum number of paths from s to t which share no vertices

Vertex-Disjoint Paths Algorithm

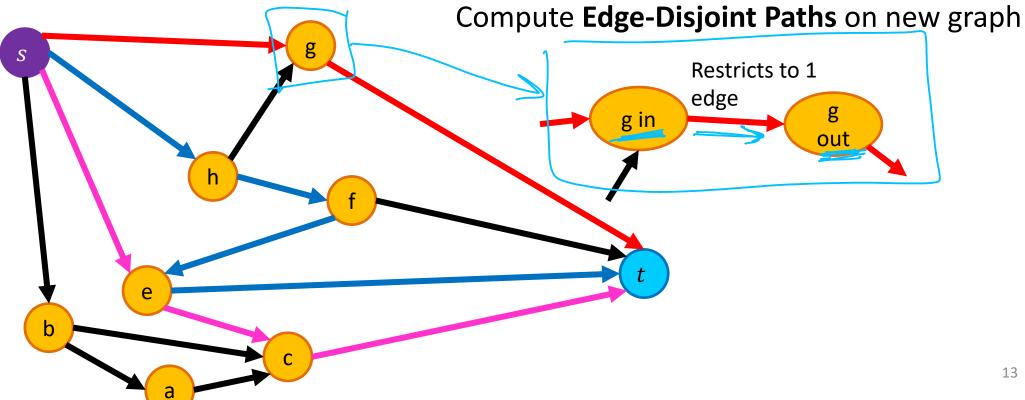

Idea: Convert an instance of the vertex-disjoint paths problem into an instance of edge-disjoint paths

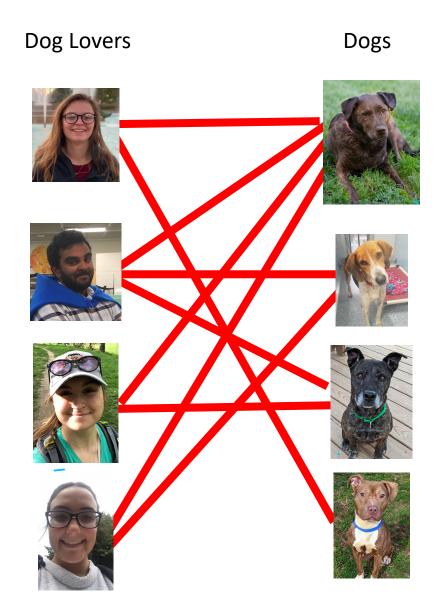

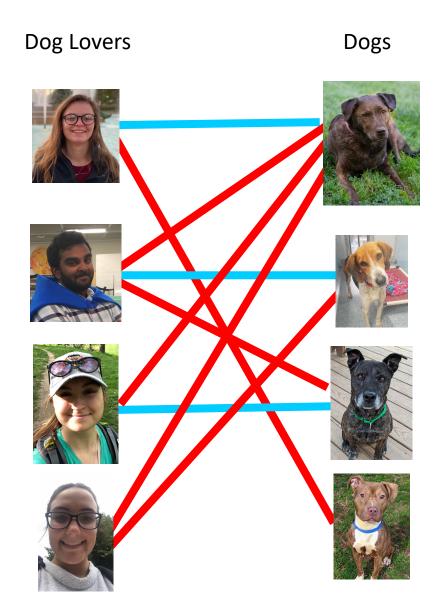

Vertex-Disjoint Paths Algorithm

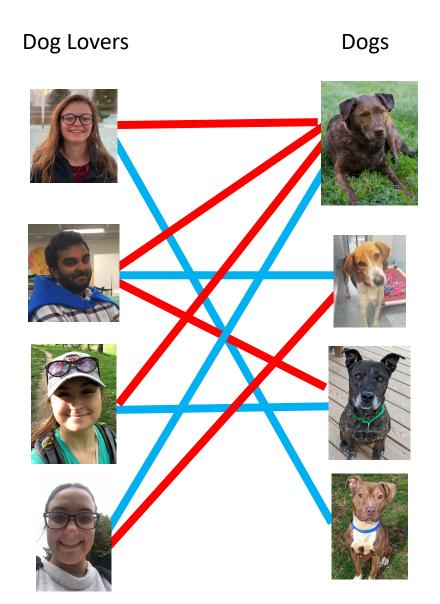

Idea: Convert an instance of the vertex-disjoint paths problem into an instance of edge-disjoint paths

Make two copies of each node, one connected to incoming edges, the other to outgoing edges

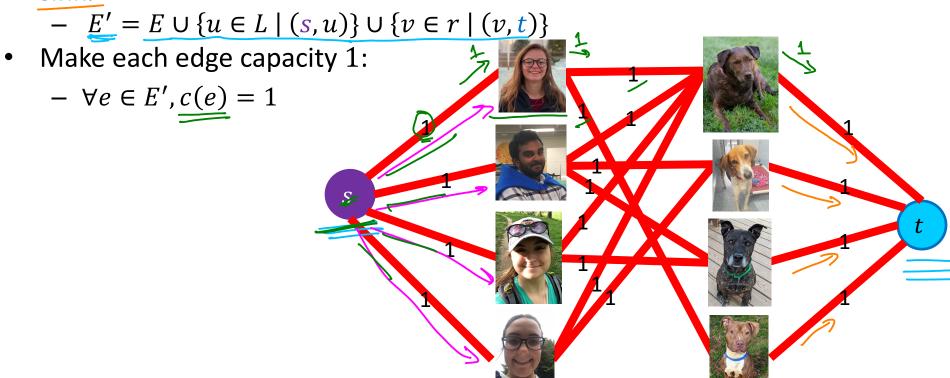

Given a graph G = (L, R, E)

a set of left nodes, right nodes, and edges between left and right Find the largest set of edges $\underline{M} \subseteq E$ such that each node $\underline{u} \in L$ or $v \in R$ is incident to at most one edge.

Maximum Bipartite Matching Using Max Flow

Make G = (L, R, E) a flow network G' = (V', E') by:

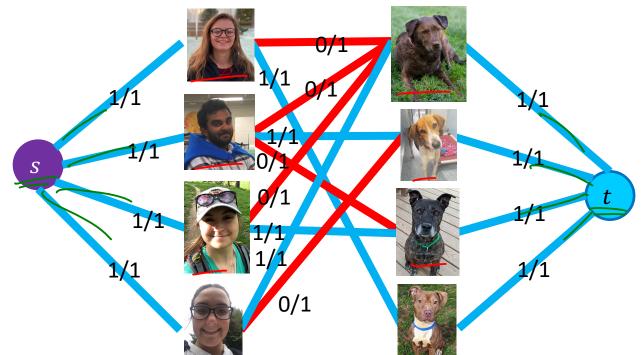

- Adding in a source and sink to the set of nodes:
 - $V' = L \cup R \cup \{s, t\}$
- Adding an edge from source to L and from R to sink:

Maximum Bipartite Matching Using Max Flow

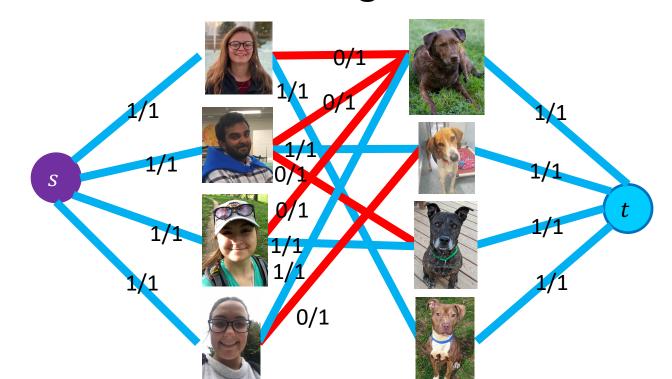

- 1. Make \underline{G} into \underline{G}' $\Theta(L+R)$
- 2. Compute Max Flow on G' $FF = O(E \cdot |f|)$ $\theta(E \cdot |g|)$ $|f| \leq \min(L_R)$

3. Return M as all "middle" edges with flow $1 \in (LR)$

Maximum Bipartite Matching Using Max Flow

- 1. Make G into $G' = \Theta(L+R)$
- 2. Compute Max Flow on G' $\Theta(E \cdot V)$ $|f| \leq L$
- 3. Return *M* as all "middle" edges with flow 1 $\Theta(L+R)$

 $\Theta(E \cdot V)$

Reductions

- Algorithm technique of supreme ultimate power
- Convert instance of problem A to an instance of Problem B
- Convert solution of <u>problem</u> B back to a solution of problem A

Reductions

Shows how two different problems relate to each other

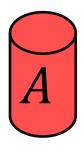

Problem we don't know how to solve

Problem we don't know how to solve

Opening a door

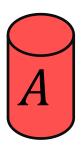

Problem we do know how to solve

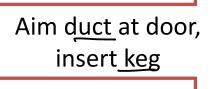

Problem we don't know how to solve

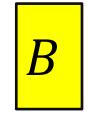

Problem we do know how to solve

how?

Problem we don't know how to solve

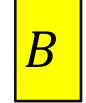

Problem we do know how to solve

Aim duct at door, insert keg

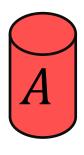

Solution for **B**

Alcohol, wood, matches

Problem we don't know how to solve

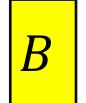

Problem we do know how to solve

Aim duct at door, insert keg

Lighting a fire

How?

Solution for *B*Alcohol, wood,

matches

Put fire under the Keg

Problem we don't know how to solve

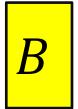

Problem we do know how to solve

Aim duct at door, insert keg

Lighting a fire

How?

Solution for A

Keg cannon battering ram

Put fire under the Keg

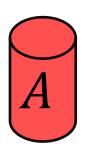

Solution for *B*Alcohol, wood,

matches

Problem we don't know how to solve

Problem we do know how to solve

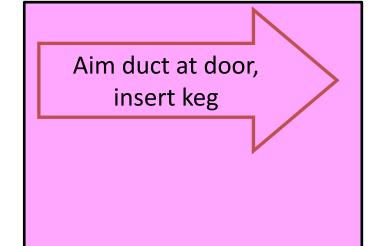

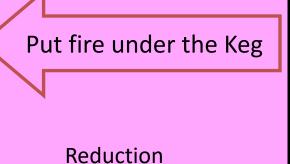

Opening a door

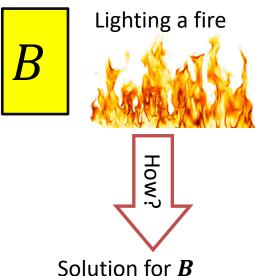

Solution for *A*Keg cannon battering ram

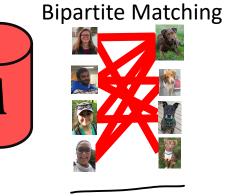

Alcohol, wood, matches

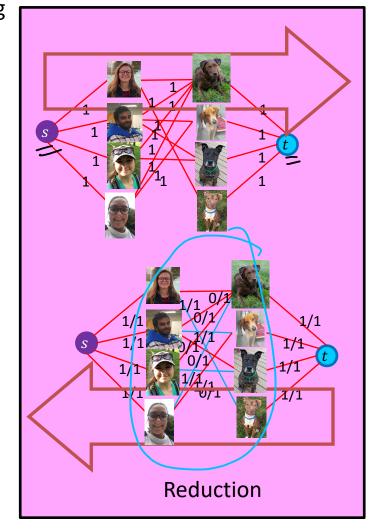

Bipartite Matching Reduction

Problem we don't know how to solve

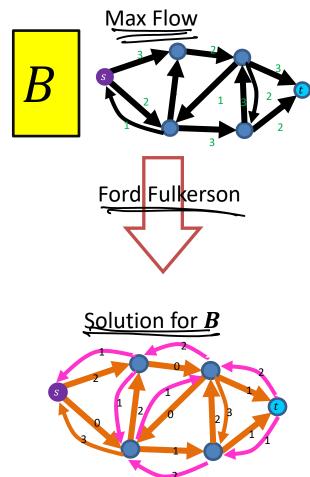

i we don't know now to s

Problem we do know how to solve

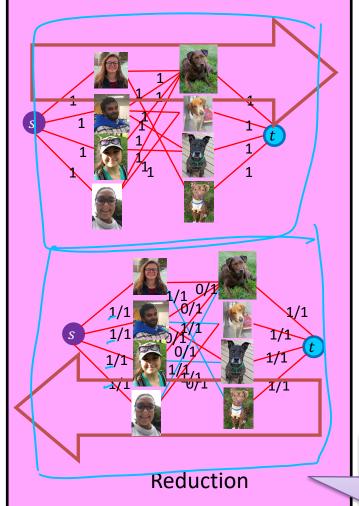

Bipartite Matching Reduction

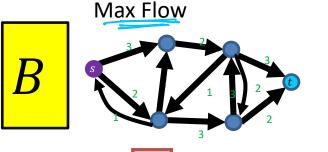

Problem we don't know how to solve

Problem we do know how to solve

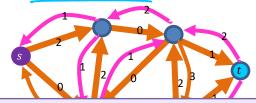

prove 2 things

1) how to make

(-ashveting)

2) why it work

Solution for **B**

Must show (prove):

- 1) how to make construction
- 2) Why it works

each peolon

t each dog

only participate

in one metalogy

max flow = may

siportize metalog

In General: Reduction

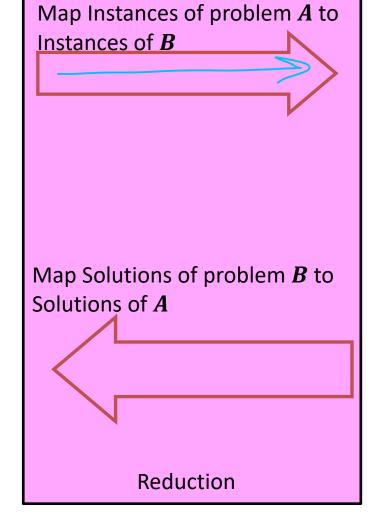

Problem we don't know how to solve

Problem we do know how to solve

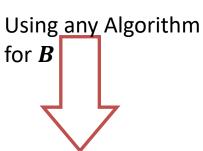

Solution for *A*

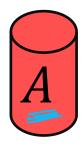

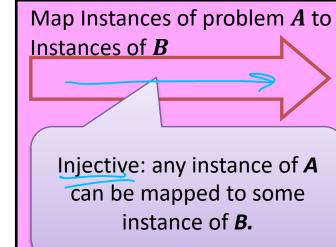

In General: Reduction

Problem we don't know how to solve

Problem we do know how to solve

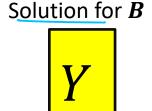

Injective: any instance of A can be mapped to some instance of **B**. Map Solutions of problem **B** to Solutions of *A* Reduction

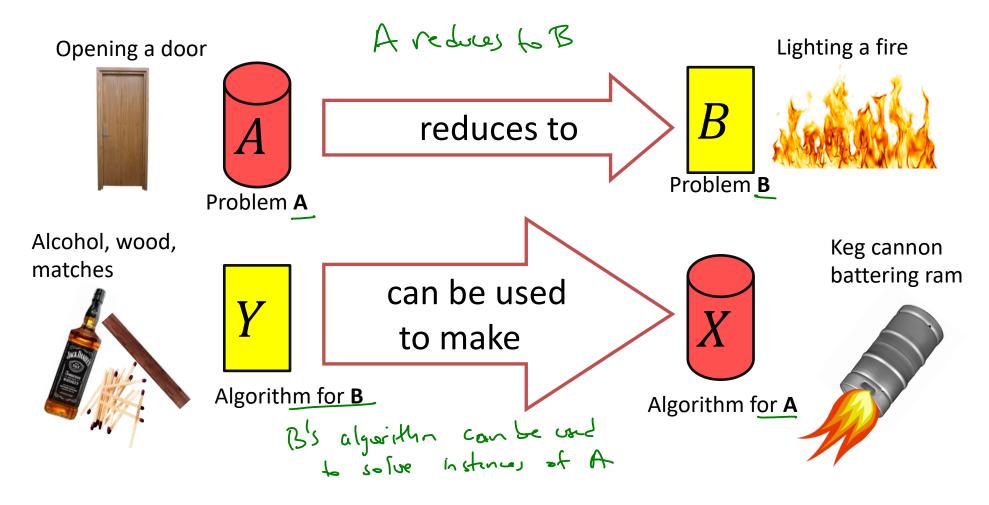

Using any Algorithm for **B**

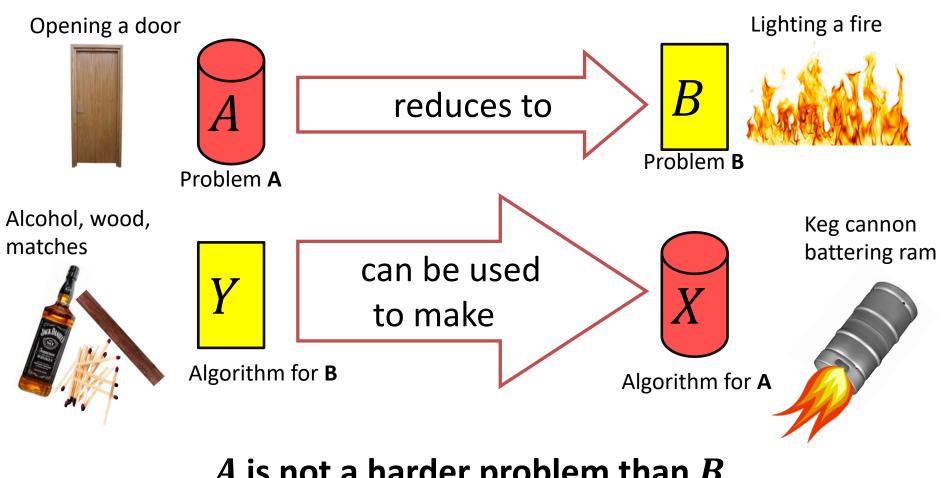

Worst-case lower-bound Proofs

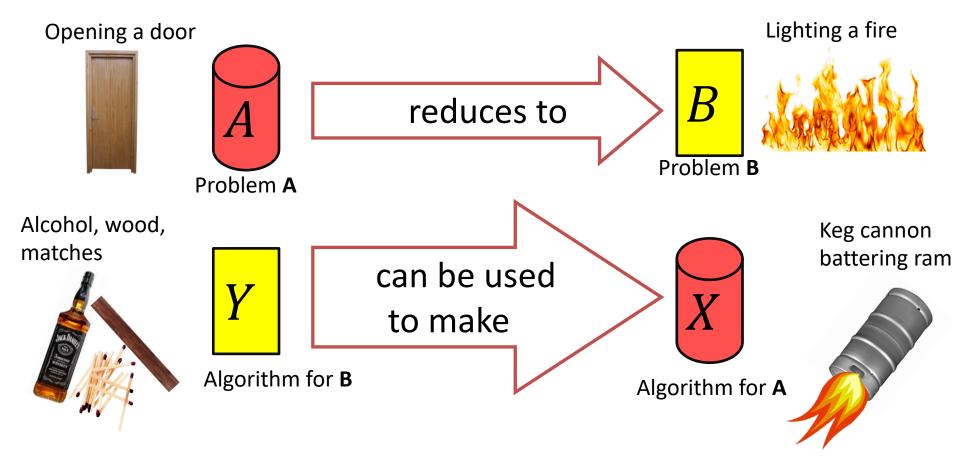

Worst-case lower-bound Proofs

A is not a harder problem than B

$$\underline{\underline{A} \leq \underline{B}}$$

Worst-case lower-bound Proofs

A is not a harder problem than B

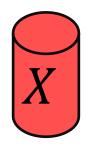

$$A \leq B$$

The name "reduces" is confusing: it is in the opposite direction of the making

To Show: Y is slow

To Show: *Y* is slow

1. We know X is slow (by a proof) (e.g., X = some way to open the door)

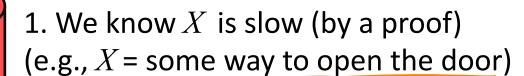

1. We know X is slow (by a proof) (e.g., X = some way to open the door)

2. Assume Y is quick [toward contradiction] (Y = some way to light a fire)

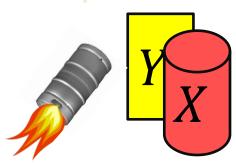

To Show: Y is slow

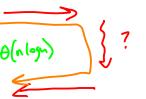

2. Assume Y is quick [toward contradiction] (Y = some way to light a fire)

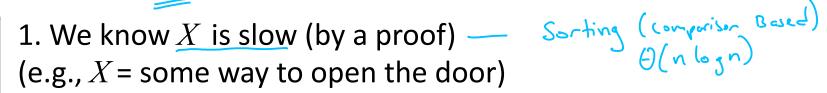

3. Show how to use Y to perform X quickly

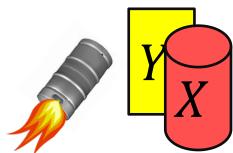

2. Assume Y is quick [toward contradiction] (Y = some way to light a fire)

3. Show how to use Y to perform X quickly for the $\Theta(n \log n)$

4. X is slow, but Y could be used to perform X quickly conclusion: Y must not actually be quick
